### Article abstract

This study examines earnings inequality by gender and academic field among senior university administrators, including presidents, vice presidents, associate and assistant vice presidents, and deans, using data from the Canadian province of Ontario. While a 4.4 percent earnings gap between male and female administrators is initially identified, much of the gap is explained by earnings inequality across academic fields and by the career experience of the administrators. Administrators who specialize in professional fields such as engineering, health sciences, law, and social work earn between 12 percent and 33 percent more than administrators who specialize in liberal fields in the humanities and social sciences.

# EARNINGS DIFFERENCES AMONG SENIOR UNIVERSITY ADMINISTRATORS: EVIDENCE BY GENDER AND ACADEMIC FIELD

COLIN F. MANG  
WILFRID LAURIER UNIVERSITY

## Abstract

This study examines earnings inequality by gender and academic field among senior university administrators, including presidents, vice presidents, associate and assistant vice presidents, and deans, using data from the Canadian province of Ontario. While a 4.4 percent earnings gap between male and female administrators is initially identified, much of the gap is explained by earnings inequality across academic fields and by the career experience of the administrators. Administrators who specialize in professional fields such as engineering, health sciences, law, and social work earn between 12 percent and 33 percent more than administrators who specialize in liberal fields in the humanities and social sciences.

**Keywords:** academic executive, compensation, field of study, gender, salary

## Résumé

Cette étude examine les différences de salaire selon le sexe et le domaine de spécialisation chez les cadres supérieurs des universités, y compris les présidents, les vice-présidents, les vice-présidents associés, les vice-présidents adjoints et les doyens, à l'aide de données de la province canadienne de l'Ontario. Si initialement un écart salarial de 4,4 % est présent entre les administrateurs hommes et femmes, cet écart s'explique en grande partie par l'inégalité des salaires entre les domaines de spécialisation et par l'expérience professionnelle des administrateurs. Les administrateurs spécialisés dans des domaines professionnels tels que l'ingénierie, les sciences de la santé, le droit et le travail social ont des salaires de 12 % à 33 % plus élevés que les administrateurs spécialisés dans les domaines libéraux en sciences humaines et sociales.

**Mots-clés :** gestionnaire académique, rémunération, domaine d'études, genre, salaire

## Introduction

There has been growing interest in the topic of executive compensation as the wages of executives have, over the past few decades, grown significantly faster than the wages of those they manage, particularly in the United States (e.g. Mishel & Sabadish, 2013) and Canada (e.g. Mendleson, 2012). However, few studies have examined compensation among senior university administrators, also referred to in the literature as academic executives, i.e. those who manage universities. Furthermore, as most studies of administrator compensation have focused solely on university presidents, little work has been done to assess differences in compensation among administrators below the rank of president. This study examines earnings differences by gender and academic

field among administrators throughout the organizational hierarchy.

A large body of literature has examined earnings differences between males and females and has identified productivity related, non-productivity related, and possible discriminatory factors contributing to earnings differences. Given that compensating men and women with equivalent qualifications differently for performing the same job is unethical, identifying whether such practice still occurs in the university sector would be of key public interest.

Studies of university faculty earnings (e.g. Brown, Troutt, & Prentice, 2011; Ehrenberg, McGraw, & Mrdenovic, 2006) have shown that those in professional disciplines, (for example business, engineering, and law),

earn significantly more than those in liberal disciplines in the humanities and social sciences. However, whether earnings differentials by academic field among faculty translate into earnings differentials among already highly compensated administrators has not been thoroughly explored in the literature to date.

The literature examining compensation for university administrators is small and focused primarily on the earnings of university presidents / vice-chancellors. While a few studies such as Clements and Izan (2008) and Essaji and Horton (2010) have examined compensation of administrators below the rank of president, Monks and McGoldrick (2004) is the only study thus far to focus on the gender earnings gap among administrators; however, that study does not consider individual characteristics such as academic field which could affect earnings, leading to a biased estimate of the earnings gap. There is thus significant opportunity to expand the literature examining administrator compensation by considering gender and academic field differentials throughout the hierarchy of university administration.

The following section provides a review of the literature. Next, a framework is developed to model administrator earnings and assess earnings differentials. The model is tested using data from the Canadian province of Ontario for the years 2000–2011. Ontario universities compete in a continent-wide market for university administrators and numerous individuals in the sample have worked in multiple US states and/or Canadian provinces; therefore, compensation would be expected to be competitive and comparable with other jurisdictions given institutional characteristics such as size and reputation. However, unlike other jurisdictions where salary data is limited, Ontario law requires all institutions to publish nearly all salary records, thus providing for a much larger sample than the samples used in previous studies, and also avoiding the possibility of bias which previous studies had to contend with given that their data was drawn from non-random subsets of institutions which chose to make data available, rather than from all institutions in a jurisdiction. The study concludes with a discussion of the findings.

## Literature Review

### Salaries of University Administrators

The literature examining the earnings of university administrators is small, and nearly all studies have focused exclusively on university presidents/vice-chancellors. The only studies to examine compensation among lower ranks of administrators have been: Clements and Izan (2008) for the five highest paid administrators (positions undetermined) at Australian universities; Essaji and Horton (2010) for presidents, vice presidents, and deans at Canadian universities; Monks and McGoldrick (2004) for presidents, vice presidents, program directors, and deans at American private universities; and Pfeffer and Davis-Blake (1987) for the heads of development, admissions, business functions, alumni affairs, community services, student placement, athletics, and public relations at American universities. With only two studies examining the earnings of deans and no studies examining the earnings of associate vice presidents and assistant vice presidents, there is significant opportunity to expand the literature in this area.

Some studies (Clements & Izan, 2008; Soh, 2007; Tang, Tang, & Tang, 2000) have modeled earnings solely based on institutional characteristics; however, as gender and career background have been shown to affect compensation of executives generally (e.g. Gayle, Golan, & Miller, 2012) and university administrator compensation in particular (e.g. Bartlett & Sorokina, 2005), personal characteristics should be included in any analysis of administrator earnings.

### Male-Female Earnings Differentials

A very large literature has explored the male-female earnings gap. Reviews are provided by Blau, Ferber, and Winkler (2002), Blau and Kahn (2000), Holzer and Neumark (2000), and Gunderson (2006) among others. Numerous studies have identified productivity related factors such as differences in educational background (Chevalier, 2007; Drolet, 2002b; Livanos & Pouliakas, 2012; Napari, 2011) and firm size (Bertrand & Hallock, 2001; Drolet, 2002a) as determinants of the earnings gap, while some studies, after accounting for a range of observable characteristics, have attributed the remaining earnings gap to overt discrimination against females

(e.g. Goldin & Rouse, 2000; Gunderson, 1989; Holzer & Neumark, 2000; Jarrell & Stanley, 2004). Gender-role stereotyping has been identified as a factor contributing to females choosing particular fields of study and particular professions (Bailey, 1992; Purcell, Elias, Davies, & Wilton, 2005; U.S. Department of Education, 2001) and these “feminized” professions (i.e. female-dominated), have experienced lower earnings than male-dominated professions, thus contributing to the earnings gap (see Drewes, 2006; Hansen, 2006; Greenman & Xie, 2008; McCormick, Nunez, Shah, & Choy, 1999; Purcell et al., 2005).

As well, non-productivity related explanations of the gender earnings gap have been proposed including differing attitudes towards competitiveness (Flory, Leibbrandt, & List, 2014; Gneezy, Niederle, & Rustichini, 2003; Niederle & Vesterlund, 2007), differing attitudes towards risk (Eckel & Grossman, 2002; Le, Miller, Slutske, & Martin, 2011; Powell & Ansic, 1997; Schubert, Brown, Gysler, & Brachinger, 1999), and differing earnings expectations (Furnham & Wilson, 2011; Need & De Jong, 2008; Williams, Paluck, & Spencer-Rogers, 2010) which may lead females to accept lower pay offers. Babcock, Gelfand, Small, and Stayn (2006), Babcock and Laschever (2003), and Small et al. (2007) all show that males are more likely than females to bargain for higher salaries.

Other than Monks and McGoldrick (2004), examination of the gender earnings gap has not been a primary focus of the literature examining university administrator compensation. Nevertheless, several American studies have included gender, with Pfeffer and Ross (1988) and Ehrenberg, Cheslock, and Epifantseva (2001) identifying instances in which male university presidents out-earned comparable female presidents by seven percent to ten percent and by three percent to six percent respectively; however, Bartlett and Sorokina (2005) and Ehrenberg, Cheslock, and Epifantseva (2001) have also found that female presidents of liberal arts colleges out-earned comparable male presidents by nine percent and by three and a half percent respectively, while Monks (2007), Langbert and Fox (2013), and Huang and Chen (2013) do not find evidence of a gender earnings gap among university presidents. The range of these findings likely resulted from the samples employed as each study used data from non-random samplings of institutions drawn from niche subsets of the very large American college market, making comparisons between the studies diffi-

cult due to the heterogeneity of the institutions examined.

Monks and McGoldrick (2004) and Essaji and Horton (2010), examined administrators below the rank of president and found that females earned between four and thirteen percent less than their male counterparts; however, neither study examined any personal characteristics of the administrators such as academic field and academic rank which have been shown to affect the compensation of university presidents / vice-chancellors (e.g. Baimbridge & Simpson, 1996; Monks, 2007), which undoubtedly biases their estimates of the gender earnings gap given differences in the distribution of males and females across academic fields (Binder, Krause, Chermak, Thacher, & Gilroy, 2010; Brown, Troutt, & Prentice, 2011; Warman, Woolley, & Worswick, 2010) and academic ranks (Ginther & Hayes, 2003; McDowell & Smith, 1992; Ornstein, Steward, & Drakich, 2007; Wijesingha & Ramos, 2017). Therefore, there is a significant opportunity to explore the male-female earnings differential among university administrators throughout the executive hierarchy.

## Earnings and Academic Field

A large body of literature has explored differences in graduate earnings across academic fields with numerous studies identifying higher earnings among graduates of professional programs such as business and engineering compared to graduates of liberal programs in the humanities, social sciences, and sciences (e.g. Altonji, Blom, & Meghir, 2012; Boothby & Drewes, 2006; Chia & Miller, 2008). Jalbert, Furumo, and Jalbert (2011) and Palia (2000) specifically show that academic field can affect executive compensation and position within private sector organizations.

Within universities, numerous studies have shown that faculty specializing in professional fields such as business, engineering, law, and medicine earn more than faculty specializing in education, humanities, social sciences, or sciences (e.g. Brown, Troutt, & Prentice, 2011; Doucet, Durand, & Smith, 2008; Ehrenberg et al., 2006; Warman et al., 2010) while Binder et al. (2010) show that these differences contribute to an earnings differential between male and female faculty members as higher paying fields have a higher proportion of male faculty members. However, an examination of academic field is not commonly considered in studies of administrator compensation. Baimbridge and Simpson (1996) find that

UK vice-chancellors who specialized in science earned 4.5 percent more than those who specialized in engineering and twelve percent more than those who specialized in humanities or social sciences. Bartlett and Sorokina (2005) examine whether presidents of American liberal arts colleges who specialized in business, economics, or law earn more than presidents from other fields, but their estimated premiums of four percent for salary and two percent for total compensation including non-salary benefits are not statistically significant. Monks (2007) found that presidents of American private universities who specialized in sciences earned eleven percent more than those who specialized in social sciences, but could not find statistically significant differences in earnings among other fields at either private or public institutions, possibly because of the very small sample sizes employed ( $n = 67$  for public universities and  $n = 49$  for private universities).

The existing literature examining the effect of academic field on the earnings of universities presidents is limited, and although Essaji and Horton (2010) provide some measure of differentiation by separating deans of business, engineering, and health sciences from other deans, there is a substantial gap in the literature as the impact of academic field on the earnings of university vice presidents, associate vice presidents and assistant vice presidents, and deans has not previously been explored.

## Methodology

As in previous studies, the natural log of a university administrator's total compensation including both salary and benefits, expressed in constant year 2000 dollars, is modeled in Equation 1 as a function of the administrator's gender, academic field, position, and career background including academic rank (if any), years in their current position, and estimated years of professional work experience, which is calculated as in Binder et al. (2010) by examining the time since the completion of the individual's highest university degree<sup>1</sup>.

As in Monks (2007), Langbert and Fox (2013), and Pfeffer and Ross (1988), whether an administrator is hired externally or promoted internally is also considered, as those hired externally have greater bargaining power in salary negotiation since they may require a wage premium to change organizations, and are being offered the position over - and are therefore more desirable than - any internal candidates (if any). In contrast, internal hires

may be willing to accept a wage penalty for the convenience of obtaining a more senior position without having to change institutions. Examining the premium obtained by external hires and comparing the outcomes for males and females should also contribute to understanding whether males and females experience different bargaining conditions / outcomes.

The size of each institution is measured by its (log) revenues in year 2000 constant dollars (see Clements & IZan, 2008; Huang & Chen, 2013; and Soh, 2007). The annual Macleans university rankings, which Cyrenne and Grant (2009) show to be a good proxy for institutional quality, are included to account for the impact on earnings of both relative quality among the institutions and changes in relative quality over time. As not all universities appear in the rankings each year, unranked institutions are assigned the next value below the lowest ranked institution as in Monks and Ehrenberg (1999). As several institutions in the sample operate subsidiaries/secondary campuses, or have federated structures with affiliated universities/colleges, whether an administrator works within one of these subordinate organizations is included as a control. Finally, as Essaji and Horton (2010) have shown that salaries have been rising in real terms over time, a series of Time Effects is included to account for sector-wide changes in earnings.

$$\begin{aligned} \ln(\text{Total Compensation}) &= \beta_0 + \beta_F \text{Female} + \beta_A \text{Academic Field} + \beta_C \text{Career Background} \\ &+ \beta_P \text{Position} + \beta_I \text{Institutional Controls} + \beta_T \text{Time Effects} + \epsilon \end{aligned} \quad (1)$$

As there is no standard list of job titles corresponding to the responsibilities of university administrators that are common to all institutions, this study uses a framework similar to that proposed by Essaji and Horton (2010) for establishing equivalency between various job titles for comparison purposes. The list of job titles considered to be equivalent is presented in Table 1. Given the wide range of decanal positions, aggregation among deans for some professional programs and for some liberal programs is necessary. As an individual's academic field will be considered, assigning deans to these categories will only identify any "extra" wage premium that comes from being the dean of a particular professional faculty relative to being a dean in a liberal faculty; i.e. combining a dean of law with a dean of social work is not detrimental, even if higher wages are paid to law specialists than to social work specialists, because the returns to academic field would account for the difference. Similarly, combining a dean of science with a

dean of arts also does not pose identification problems so long as academic field is also considered.

Similar to Essaji and Horton (2010) and Monks and McGoldrick (2004), this study considers the total compensation for presidents, vice presidents, and deans. In addition, this study considers associate vice presidents and assistant vice presidents which have not previously been examined in the literature.

in nominal terms since 1996, which may create some bias in the data in the earliest years as some of the mid-level executives, such as deans and assistant vice presidents did not reach the earnings threshold. However, that problem affected all institutions, and as nominal wages rose throughout the sector, more individuals were captured at every institution. To compensate for this problem, this study uses only data from the year 2000 onward when

**Table 1.** List of Job Title Equivalencies by Position Category

Title	Alternative Equivalent Titles
President	President and Vice-Chancellor, Principal and Vice-Chancellor, Principal
Vice President Academic	Provost, Vice President Academic Affairs, Vice President Academic and Provost, Vice President Academic and Research, Vice Principal Academic, Vice Principal Academic and Provost
Vice President Administration	Vice President Administration and Finance, Vice President Administration and Student Affairs, Vice President Finance, Vice President Finance and Administration, Vice President Operations and Finance, Vice President Planning and Administration, Vice Principal Operations and Finance
Vice President External	Vice President Advancement, Vice President Alumni Affairs and Development, Vice President Development and Public Affairs, Vice President External Relations, Vice President University Advancement, Vice President University Affairs, Vice Principal Advancement
Vice President Research	Vice President Research and Development, Vice President Research and International Affairs, Vice President University Research, Vice Principal Research
Other Vice President	Includes all other Vice Presidents such as Vice President of Business Affairs, Vice President of Human Resources, Vice President of Strategic Initiatives, Vice President of Students, etc.
Associate Vice President	Associate Provost, Associate Vice Principal, Deputy Provost, Vice Provost
Assistant Vice President	—
Dean of Business	Dean of Management
Dean of Engineering	Dean of Science and Engineering
Dean of Health Sciences	Dean of Medicine, Dean of Dentistry, Dean of Pharmacy
Dean of Professional Faculty	Dean of Agriculture, Dean of Applied Health Sciences, Dean of Law, Dean of Nursing, Dean of Social Work, Dean of Veterinary Medicine
Dean of Liberal Faculty	Dean of Arts, Dean of Arts and Sciences, Dean of Education, Dean of Fine Arts, Dean of Graduate Studies, Dean of Humanities, Dean of Sciences, Dean of Social Sciences

## Data

Earnings data are drawn from the Public Sector Salary Disclosure files of the Ontario Ministry of Finance which reports the total salary and taxable benefits of each university employee whose combined salary and benefits total more than \$100,000. The \$100,000 limit has been fixed

salaries were sufficiently high for effectively all administrators to be captured. As earnings data is provided for each tax year, from January 1st to December 31st, any observations from an administrator who did not remain in a position for the full calendar year are excluded. Earnings data are supplemented with biographical information

gathered from university and personal websites, library archives, department records, curricula vitae, LinkedIn profiles, public records, and direct contacts.

Of the 836 administrators in the database, detailed background information was obtainable for 711 (85 percent). Two assistant professors, one female and one male representing four observations in total were removed due to a lack of comparators. The remaining 709 administrators yielded a total sample size of 3190 observations over twelve years. Table 2 describes the features

of the 709 administrators examined by academic field, career background, and position held. Of the 487 male administrators examined, 363 succeeded another male administrator upon taking up the position, 68 succeeded a female administrator, and 56 were the initial holders of newly created positions. Of the 222 female administrators examined, 130 succeeded a male administrator upon taking up the position, 45 succeeded another female administrator, and 47 were the initial holders of newly created positions.

**Table 2.** Characteristics of the Senior University Administrators, 2000–2011

	Number of University Administrators		Number of Observations	Average Earnings (Year 2000 Constant \$)
	Male	Female		
Total	487	222	3190	164,894

Dean of Professional Faculty	27	20	187	158,007
Dean of Liberal Faculty	161	66	849	135,772

<sup>a</sup> Figures for number of administrators by position do not sum to total number of administrators listed above because some administrators changed position and therefore provide observations in more than one position category.

## Analysis of Academic Executive Salaries

Various specifications of Equation 1 are estimated using the Stata software package, with standard errors clustered by individual university administrator. The results are reported in Columns I through IV of Table 3. The reference case or constant term (intercept of the equation) is the log earnings of a dean of a liberal faculty member who is male (Columns I, II, III, IV), a specialist in a humanities field (Columns II, IV, V, VI), has had a career in the academy (Columns II, II) has obtained the rank of professor (Columns III, IV, V, VI), and who has been promoted internally (Columns III, IV, V, VI). The coefficients listed in the table represent the estimated difference in log earnings between an individual in the reference case and an individual with a different characteristic. Most of the variability in earnings is accounted for by executive position, institutional characteristics, and time; however, the inclusion of educational background and career background in Columns II, III, and IV respectively provide insights into the gender earnings disparity identified in Column I. Columns V and VI estimate the model separately for males and females respectively. Column VII reports the results of a Hausman chi-squared test of the difference between coefficients in the male and female model specifications; the test is conducted using the *Stata* *suest* function.

Female administrators are shown to earn about 4.4 percent less on average than male colleagues after ac-

counting for position, institutional characteristics, and whether the individual pursued a career in the academy or is a professional administrator. However, this gap is largely explained by earnings differences across academic fields, and by career background. After accounting for these characteristics, the earnings gap is only 2.6 percent and is not statistically significant. Administrators with a background in health science earn substantially more than all other administrators, while those in business, engineering, law, nursing, and social work earn premiums of between 5.5 and 15.5 percent over administrators with backgrounds in humanities, sciences, and social sciences.

Each additional year of work experience increases an administrator's earnings by 0.3 percent in real terms, while each additional year spent in the same position brings a further 1.2 percent real increase in earnings. External hires receive on average 9.1 percent more than those promoted internally.

Given the great degree of heterogeneity in job tasks performed by associate vice presidents and assistant vice presidents, and in particular the question of whether associate/assistant vice presidents coming from a career in the academy are comparable to those with a professional administrative background, the analysis is run separately for this group of administrators and the results for academics and professional administrators are compared using the method described above. The results reported in the Appendix show that the groups are comparable. No statistically significant differences among males and females across these groups are found, nor are the returns to academic field shown to be different,

with the exception of engineering professors/associate professors who earn a premium over professional engineers. The only significant difference between associate/assistant vice presidents with an academic career and those without is a premium paid to external hires coming from a career in the academy.

Table 4 extends the analysis to examine what impact the gender of an administrator's predecessor, if any, contributes to an earnings differential among male and female administrators. Results are reported relative to male administrators who are the initial holder of a newly created position. The difference in earnings between a male administrator who succeeded another male and a

male administrator in a newly created position is not statistically significant, nor is the difference in earnings between a male administrator who succeeded a female and a male administrator in a newly created position statistically significant. Likewise, the difference in earnings between a female administrator who succeeded a male and a male administrator in a newly created position is not statistically significant. However, the earnings of a female administrator who succeeded another female and the earnings of a female administrator in a newly created position are 6.8 percent and 7.0 percent lower than the earnings of a male administrator in a newly created position respectively.

## Discussion

This study has found an earnings gap of 4.4 percent between male and female senior university administrators through the first decade of the twenty-first century when accounting for executive position and institutional characteristics, an amount smaller than the 13 percent gap identified by Monks and McGoldrick (2004) in the 1990s and similar to that reported in Essaji and Horton (2010). However, by considering the academic fields and career experience of the administrators, the earnings gap falls to only 2.6 percent and is no longer statistically significant, suggesting that previous studies which have ignored personal characteristics of the administrators have overstated the true earnings gap attributable to gender,

in particular because the distribution of males and females across academic fields differs.

The impact of academic field on administrator earnings has not been thoroughly explored in the literature as the three previous studies to consider the characteristic have been limited in scope and focused solely on presidential/vice-chancellor salaries: Bartlett and Sorokina (2005) only examined differences in presidential salaries between business, economics, law, and liberal arts specialists while Baimbridge and Simpson (1996) and Monks (2007), relying on small sample sizes of between 49 and 67 observations could find a statistically significant premium only among sciences specialists compared to humanities and social sciences specialists. This study thus adds to the literature on university administrator earnings

by expanding the examination of academic fields considered and by examining administrators further down the organizational hierarchy.

The pattern of administrator earnings across academic fields is consistent with studies of faculty earnings (e.g. Brown et al., 2011; Ehrenberg et al., 2006; Toutkoushian, Bellas, & Moore, 2007; Warman et al., 2010) in which those in professional fields have been shown to earn more than colleagues in liberal fields. Such earnings differentials among faculty are typically justified based on the alternative employment prospects of those in particular professional fields (for example doctors, engineers, lawyers, etc.), and on the differing nature of the work performed – professors of engineering produce new engineers with high average earnings profiles while professors of humanities subjects produce graduates with much lower average earnings profiles (e.g. Boothby and Drewes, 2006).

While 81 percent of administrators examined have come from a career in the academy, they have moved from (potentially) doing very different jobs to doing similar types of work since, for example, the role of a Vice President Academic would be similar whether the incumbent was a biologist, a philosopher, or an engineer. That the distribution of earnings among administrators based on their academic field mirrors the distribution among faculty based on academic field suggests that it is the result of a market differential due to specialists in some fields having greater alternative employment options. As shown in Table 3, the earnings premiums for academic fields completely explain the differences in earnings among most deans, with the exception of deans of business and health science who earn significant premia over all other deans. Possible explanations for why these two types of deanships earn such large premia might include higher tuition revenues in these fields or increased job complexity relative to deans of other disciplines, and it is recommended that these differences relative to other deans be a topic for further study.

While, Binder et al. (2010) have shown that the unequal distribution of males and females across academic fields accounts for part of the gender earnings differential among faculty, the same outcome is evident here; male administrators are more likely than their female counterparts to have specialized in a health science discipline or in engineering, two of the three fields with the highest earnings premiums. As shown in Table 3, roughly one fifth of the initial gender earnings gap identified can be

explained by earnings differences across academic fields.

While differences in bargaining outcomes between males and females have been noted in the literature (Babcock et al., 2006; Babcock & Laschever, 2003; Small, Gelfand, Babcock, & Gettman, 2007), the evidence presented here is mixed. One indicator of bargaining in this market, the salary premium negotiated by those hired externally, differs by only 1.6 percent between males and females and that difference is not statistically significant, suggesting that females, as external candidates, may not be disadvantaged in bargaining and may behave in a manner similar to males. However, Table 4 demonstrates that female administrators entering newly created positions earn less than male administrators in newly created positions, indicating that, without the benefit of an incumbent's salary level to use as a benchmark, females are offered and accept lower compensation than their male peers. Furthermore, as shown in Table 3, a one percent increase in revenue corresponds to a 7.4 percent increase in male administrator earnings but a 12.2 percent increase in female administrator earnings, implying that females are more disadvantaged in smaller institutions, a result consistent with studies of the private sector which have shown that the gender earnings gap is larger in smaller firms (Bertrand & Hallock, 2001; Drolet, 2002a).

From the perspective of achieving gender earnings parity, these results are encouraging. Although previous studies have shown a large significant earnings gap between male and female university administrators across the organizational hierarchy, much of the gap can be accounted for by personal factors other than gender which had not previously been considered, indicating that female administrators are much closer than previously thought to achieving earnings parity with their male colleagues. Nevertheless, earnings inequality among university administrators from different academic fields raises important questions of equity, productivity, and the desirability of pursuing a (second) career as an administrator depending on one's academic interests. That faculty who specialize in different fields, and thus conduct different types of research and produce different types of graduates, have different earnings is well documented; however, whether engineers and lawyers make more productive or otherwise "better" administrators relative to economists and historians, and thus merit higher pay for performing the same job, is clearly a topic which should be explored in greater detail.

## Acknowledgements

The author would like to thank Prof. Colin P. Green and Prof. Steve Bradley of Lancaster University for their guidance, as well as participants at the 2018 Canadian Economics Association Conference for helpful feedback.
