FIELD TRIP OBJECTIVES

Over three days, this excursion will offer participants the opportunity to visit spectacular Carboniferous outcrops of palaeontologic, sedimentologic and structural interest in southern New Brunswick. The Norton fossil forest (Fig. 1) contains upright tree trunks smaller, but considerably older than at Jogjins. Near Sussex, soft-sediment deformation (slumping) of shale and oil shale is visible over several magnitudes, with these strata overlain by coarsening upward lake shoreface

sandstone. At Albert Mines, solid bitumen (Albertite) is abundant adjacent to abandoned mine shafts and fossil fish may be excavated with a bit of luck. Thick beds of often imbricate alluvial fan conglomerate form the ‘flower

pots’ at Hopewell Cape (Fig. 2). Salt diapirism (Fig. 3) has folded and faulted over a kilometre thickness of non-marine strata on the Maringouin peninsula.

ADDITIONAL INFORMATION

The trip will depart UNB on the Saturday morning of May 24th and returns to Fredericton on May 26th. Although this excursion will visit accessible roadside exposures, there will be significant walking along beaches (partly over boulders, and approximately 200 stairs), including one traverse 6 km (round trip) in length. Due to uneven terrain and unpredictable weather, rugged footwear and rain gear are highly recommended. Two night's accommodation in Moncton and meals will be included in the field trip registration fee.
